

# WatchMan UI/UX Design & User Flow

Navigation, homepage hierarchy, cards, details, profile and responsive UX

## Design language

WatchMan is a media-first discovery UI using large artwork, compact cards, clear navigation, responsive grids and focused detail pages. The audited frontend uses React, TanStack Start/Router, Tailwind CSS, Radix/shadcn wrappers, React Query and Zustand.

## Primary navigation

## Landing page hierarchy

Placement rule: personalized recommendations are immediately **below the Hero**.

## Listings UX

The current direction uses responsive grids, a filter panel with local draft state, Apply/Cancel behavior, URL-backed filter state and pagination that replaces the current page rather than downloading the full catalog.

## Content card

| Element               | Purpose                              |
|-----------------------|--------------------------------------|
| Poster                | Primary visual recognition.          |
| Title/name            | Content identification.              |
| Year                  | Quick context.                       |
| Rating                | Backend/TMDB rating where available. |
| Save/Saved            | Existing saved-content action.       |
| Card click            | Opens details.                       |
| Like / community vote | Deferred to a future pass.           |

## Details flow

## Profile & preferences

Profile supports view and Edit Profile states with Cancel/Save, stats and a Preferences action that reuses the existing backend preference system.

## Responsive UX

Desktop navigation collapses into a mobile drawer; grids reduce columns; filters and dialogs adapt to mobile; theme supports Light, Dark and System modes.

These diagrams are schematic documentation visuals, not browser screenshots.
